

ENERGY MONITORING

sun.factory
Deutschland
GmbH

The concept of energy monitoring means providing both a visualization of energy consumption and the means to control power distribution depending on the time of day.

Energy monitoring can be employed wherever energy is used, especially where large amounts of energy are needed for production and supply, for instance in data centers, communities, commercial properties or office complexes.

Our energy monitoring allows easy identification of energy losses and makes it easy to optimize energy production and processes. In addition, it is possible to make savings by decreasing the peak load (power control), which in turn reduces the service price paid to the energy supplier.

Advantages for you:

- Visualization of your energy consumption
- Knowledge and control of specific energy consumption
- Allocation of consumption to individual cost centers
- Optimization of energy supply and resulting reduction of costs
